IDENTITY MANAGEMENT • ACCESS CONTROL

Products and Solutions

Integrated Provisioning and Enterprise Single Sign-On

In order to maximize productivity, today's workforce demands fast, easy access to IT resources, while organizations must meet regulatory demands and internal audit requirements insuring data security and privacy compliance. The increased burdens placed on IT departments to provide convenient access for workers and ensure regulatory compliance have resulted in increased administrative costs and frustrated users.

Now with integrated provisioning and Enterprise Single Sign - On (ESSO), employees can obtain access to their accounts automatically. Once users are provisioned for all of their accounts, they simply log-on once to their network domain and all of their Windows, Web, and host-based applications can be accessed immediately without requiring a separate sign-on process for each system.

Deliver a more Secure Access Environment

The seamless integration of user provisioning and ESSO eliminates the need to transcribe credentials directly into applications, which means that end users never need to know passwords on target systems (secondary credentials) and access can be granted without distributing passwords via email or other un-secure methods. With ESSO, organizations can put in place more frequent password expirations, more complex password policies and, strong authentication methods such as tokens/PINS, smart cards, or finger print readers creating a more secure access environment. This solution yields both productivity and cost-efficiency improvements:

- Users gain access and can be productive immediately upon provisioning
- No separate registration process is required...the time lag between provisioning and ESSO credential registration is eliminated.
- ESSO credentials automatically update when users are transferred, promoted or provisioned for new systems via Courion's Account Courier.
- ESSO credentials are automatically deleted when a user leaves the organization in accordance with regulatory requirements for fast termination.

Streamline Access for Mobile Users

AccountCourier and Password Manager integration also includes support for Citrix Hot Desktop and Citrix SmoothRoaming. Hot desktop, developed for shared workstation environments that are common in hospitals, banks, manufacturers and retailers, enables users to logon/off in seconds and eliminate generic logon accounts. As users roam from one workstation/kiosk to another, SmoothRoaming ensures that applications are displayed in the exact state that the user left them, requiring only that the user reauthenticate using their primary log-on.

Products Highlights

Provisioning and Single Sign-On Seamlessly Integrated

- Users receive day one access to their applications
- There is no need to transmit secondary passwords for initial ESSO registration.
- Users do not need to register their ESSO credentials with each application separately.
- Ensure security on every level

Speed to Access Applications and Data

- Automate User provisioning
- Access multiple applications with a single set of credentials
- Ensure confidentiality and support regulatory compliance
- Enable workers to be more efficient.
